

Code BGP Platform

Intro & Demo

Lefteris Manassakis | COO, Code BGP

✉ lefteris@codebgp.com

Vasileios Kotronis | CTO, Code BGP

✉ vkotronis@codebgp.com

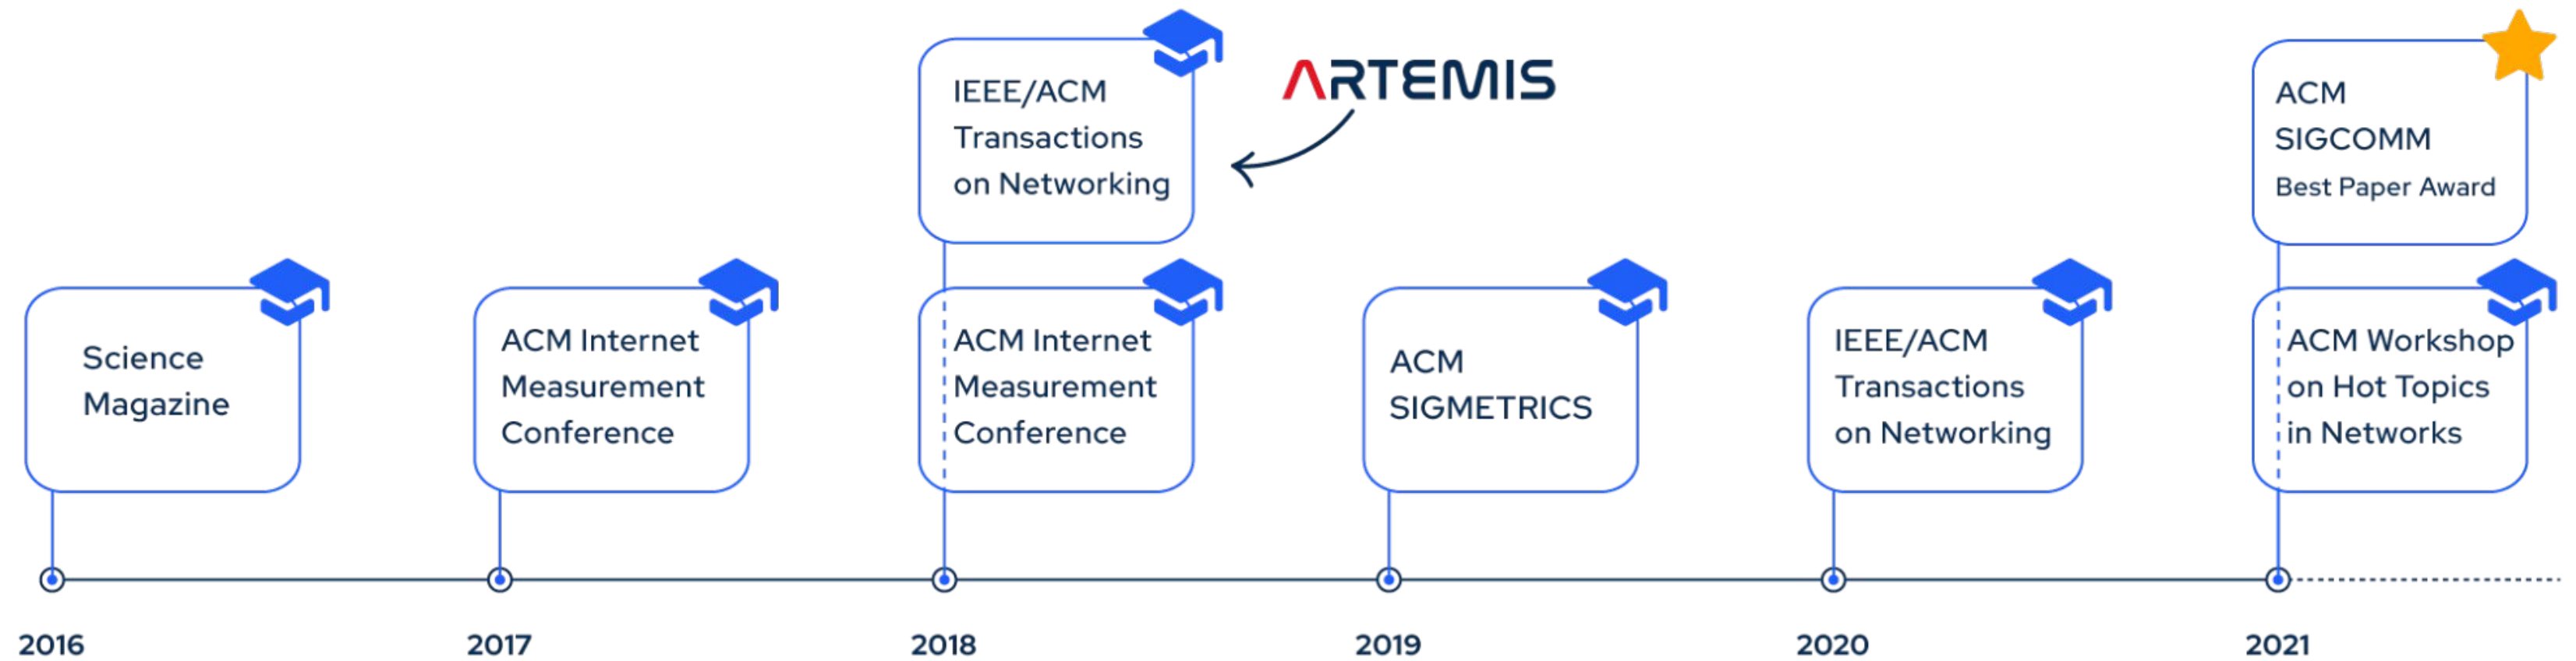

29 September 2022 | Athens

Until last year we were only researchers :)

- **Fontas Dimitropoulos**
CEO & Co-founder
- **Vasileios Kotronis**
CTO & Co-founder
- **Lefteris Manassakis**
COO & Co-founder

Publications

ARTEMIS

<https://bgpartemis.org>

- ARTEMIS is an on-prem **open-source** tool we developed and maintain
- Presented in GRNOG 7 & GRNOG 9

- We support a community of **users**

"ARTEMIS is a **fantastic** replacement for BGPmon. All around it seems like **an incredibly well-built tool** and **I use it in prod all the time**"

Chris Cummings
Network Engineer & modem.show podcast host

FORTH & MARATHON

- **Code BGP** is a **spinoff** of the Foundation for Research and Technology – Hellas
- **We raised \$1.5M** from Marathon VC

Our team

Fontas Dimitropoulos
CEO & Co-founder

Vasileios Kotronis
CTO & Co-founder

Lefteris Manassakis
COO & Co-founder

Ioannis Sermetziadis
Senior Backend Engineer

Alexandros Kazantzidis
Senior DevOps Engineer

Elias Papavasileiou
Front End Engineer

Korina Kalergi
Web & UX / UI Designer

Ioannis Gavalas
Operations & Business Analyst

Konstantinos Arakadakis
Data Analyst

Internet routing is a **blind spot**

- Network teams **are blind** to what is happening with their Internet addresses and routes
- Internet routing **misconfigurations and security incidents** can critically affect the availability and security of a business.
- **Many BGP reachability loss, hijack, and route anomalies** have made headlines.

Amazon, Facebook internet outage: Verizon blamed for 'cascading catastrophic failure'

Google traffic hijacked via tiny Nigerian ISP

DHS issues security alert about recent DNS hijacking attacks

Manually troubleshooting Internet routing is **very slow**

- Network teams need to manually troubleshoot Internet routing, which is **very slow**.
- Checking the state of a prefix in looking glass servers is an arduous task. This often needs to be repeated for many prefixes and servers, requiring **hours of repetitive manual work**.
- **No way** to seamlessly check the state of Internet routing in local and remote routers.

A new approach is needed

SaaS

Use our platform **in seconds**, without any overheads

Aggregation

Aggregate data from 100s of BGP routers and RPKI **in a single spot**

Real-time telemetry

Use **real-time telemetry** and **stream analytics**

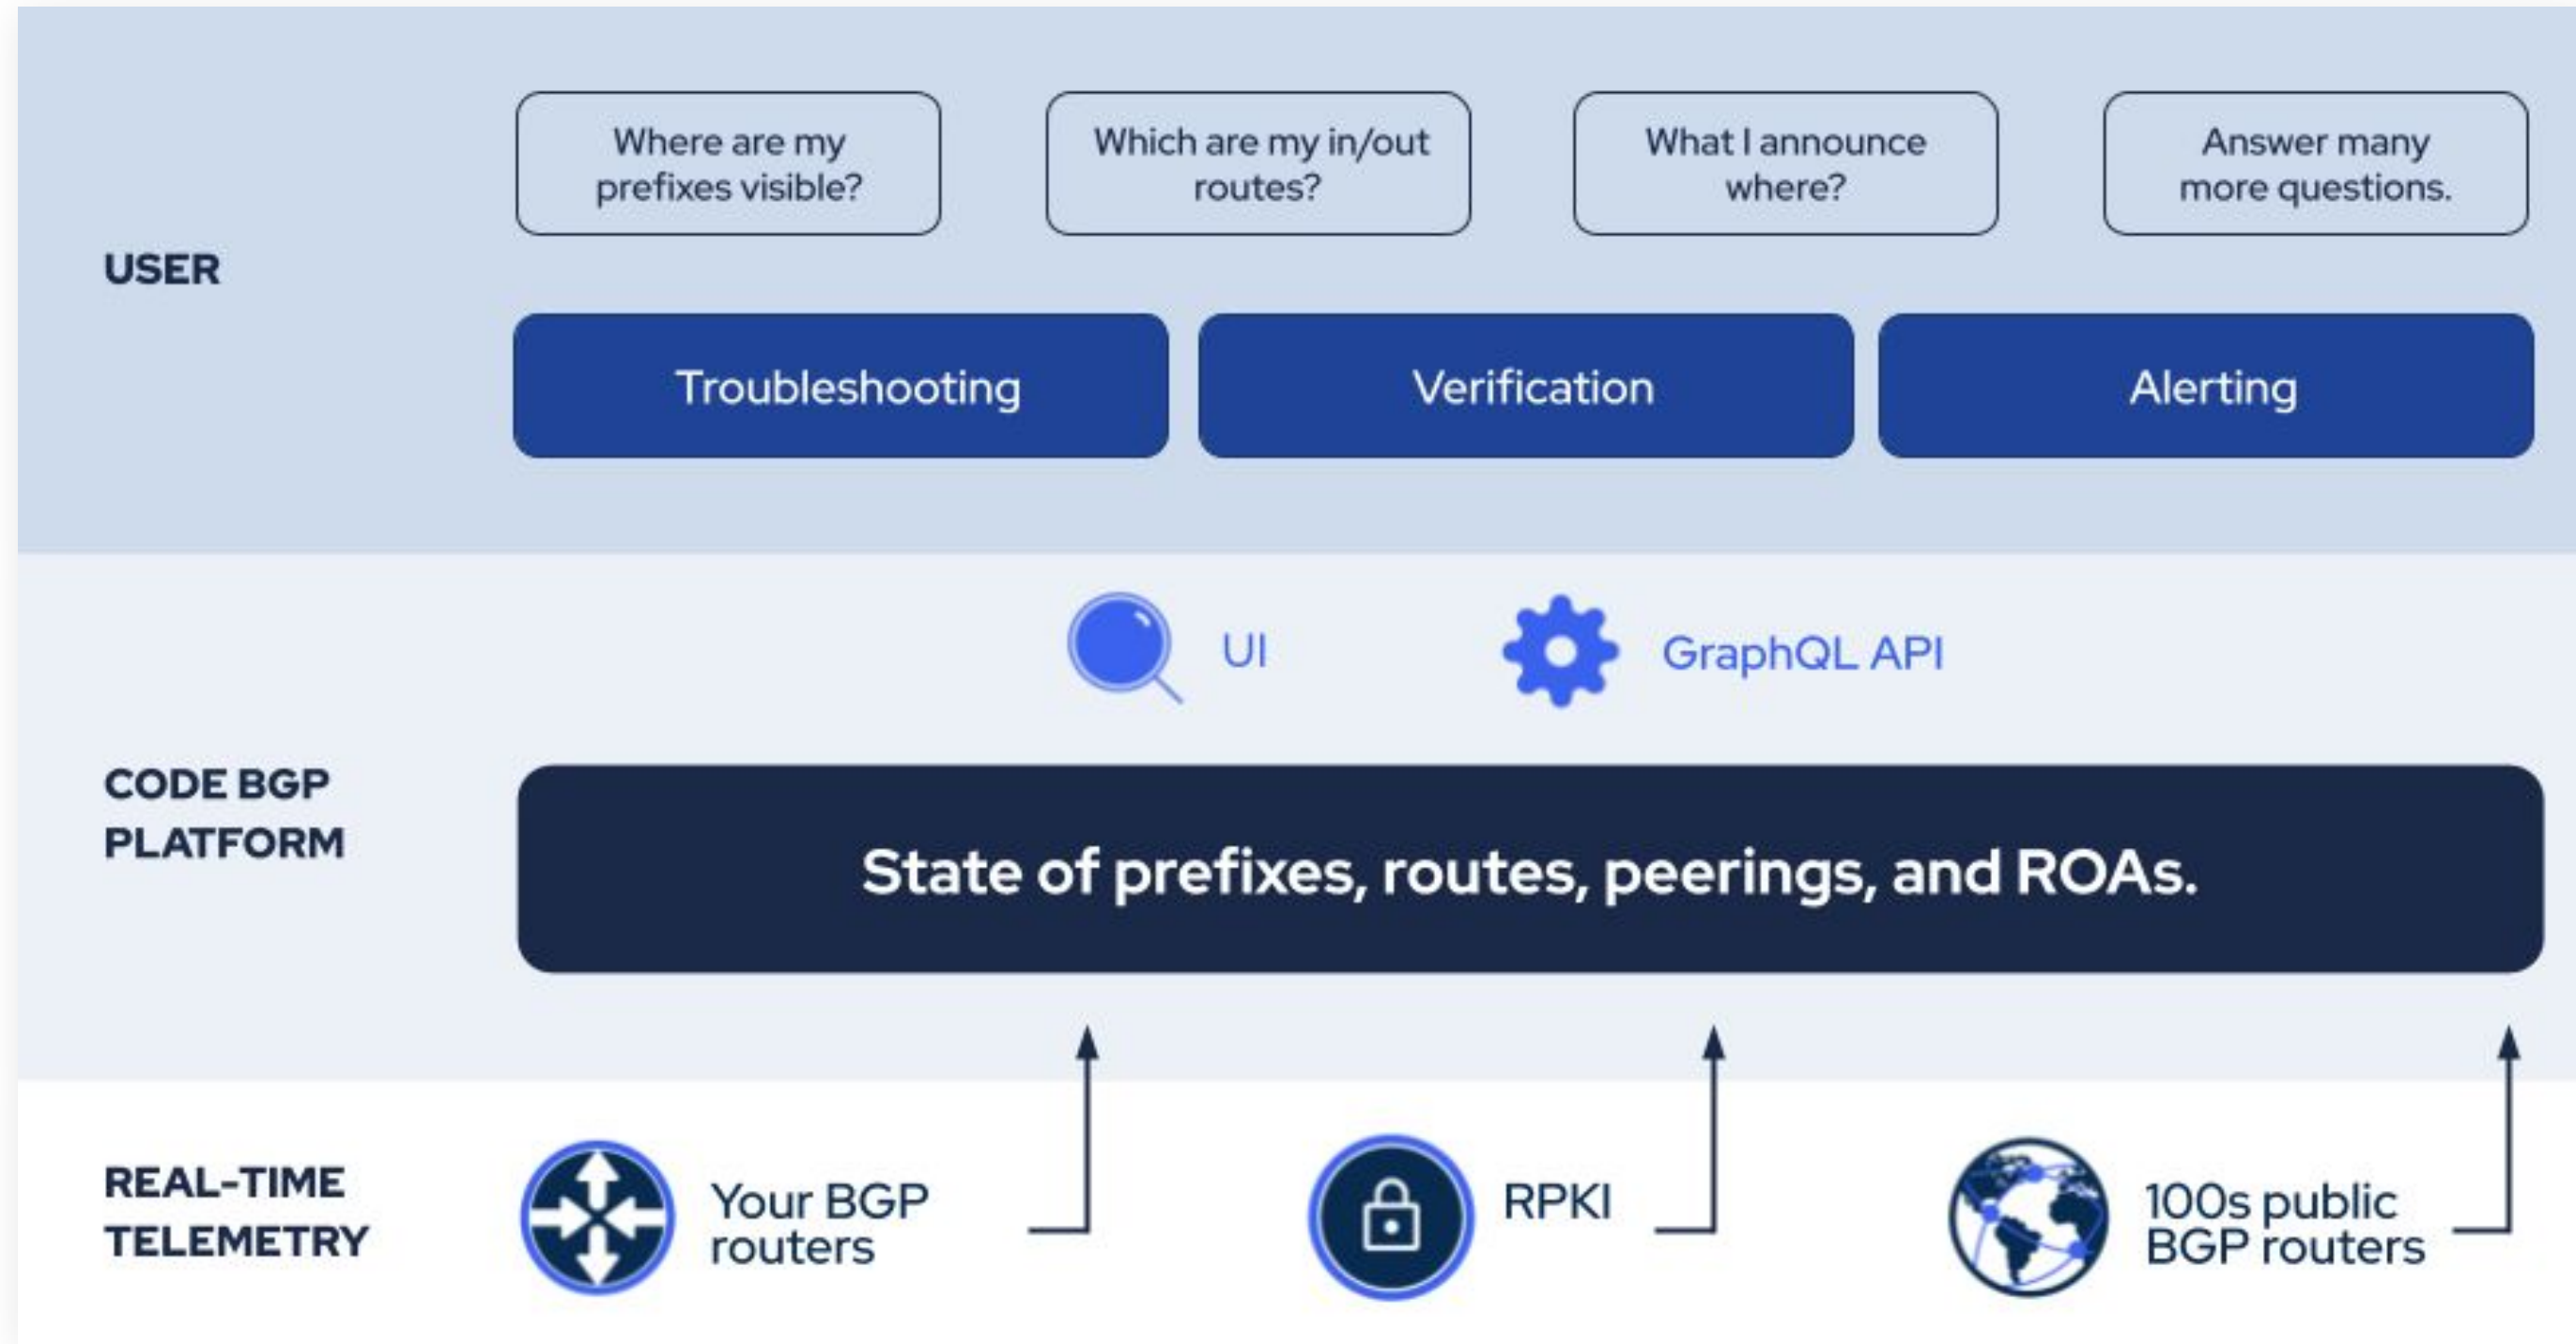

GraphQL

Get a **query language** for our **API**

Reliability and Security

Introducing Code BGP Platform

Monitor • Detect • Protect

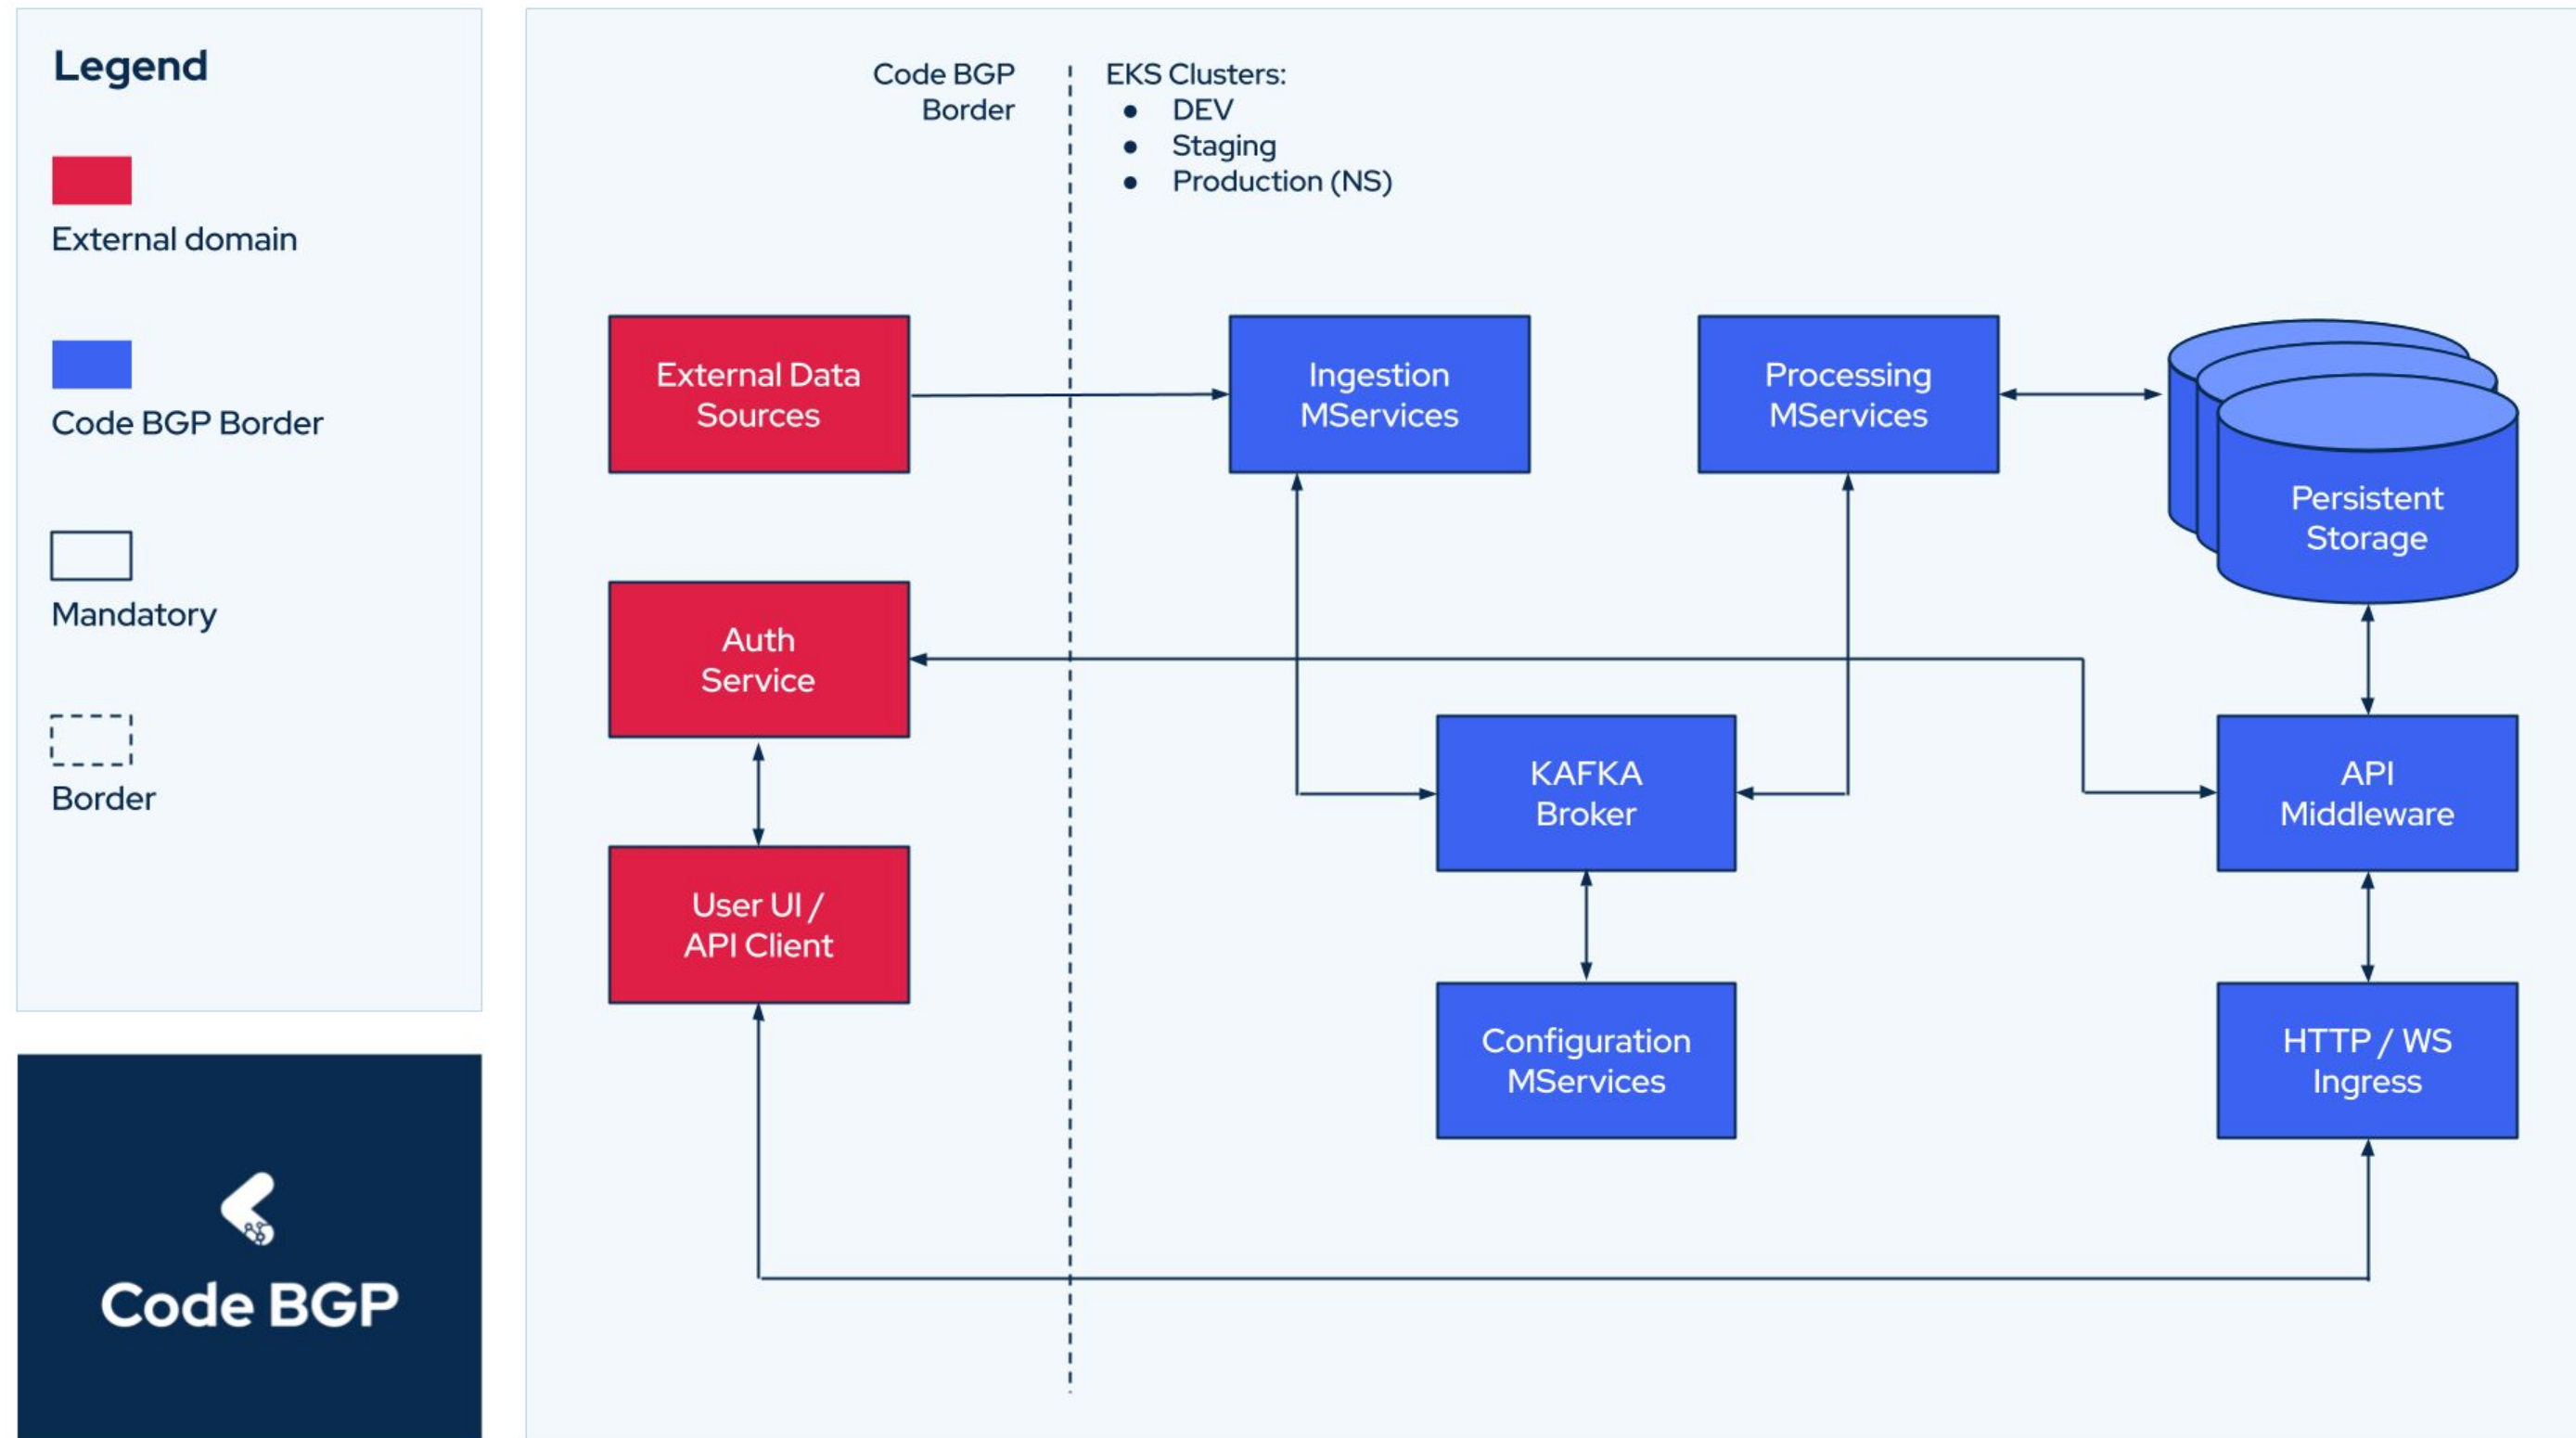

Our software stack

Stack

Software architecture

How it works

- We collect/ingest BGP data (state) from real-time (streaming) data sources
 - From: Code BGP monitors, RIS Live, BGP/BMP sessions (your own routers), RPKI
 - Via: BGP, BMP, websockets, REST, etc.
- We process and store this state in real-time
 - Data source → Kafka → Golang → PostgreSQL
- We expose it to the user in real-time (UI/API)
 - PostgreSQL → Hasura → GraphQL subscription

Data Service: RIS Live

Provides real-time JSON BGP messages via a fully filterable interactive WebSocket JSON API, and a full stream ("firehose") containing all of the messages generated by RIS. → <https://ris-live.ripe.net/>

```
{
  "prefix": null,
  "path": 50414,
  "type": null,
  "require": null,
  "moreSpecific": true,
  "lessSpecific": false,
  "host": null (all),
  "peer": null,
  "socketOptions": {
    "includeRaw": false,
    "acknowledge": true
  }
}
```

Code examples

Below are simple examples of using the RIS Live WebSocket interface.
For a full guide, see the [RIS Live manual](#).

JavaScript Python

```
/*
```

```
// Received at 09:25:59 (3.31 second delay)
{
  "timestamp": 1662877556.6,
  "peer": "2001:7f8:30:0:1:1:0:6720",
  "peer_asn": "6720",
  "id": "05-7642-108395297",
  "host": "rrc05",
  "type": "UPDATE",

Total peerings (IPv4 & IPv6): **90**

Route Collector:

- IPv4: **~42 million routes**
- IPv6: **~ 7 million routes**
- Networks: **~1,11 million prefixes**

BGP stack at monitors: Bird2

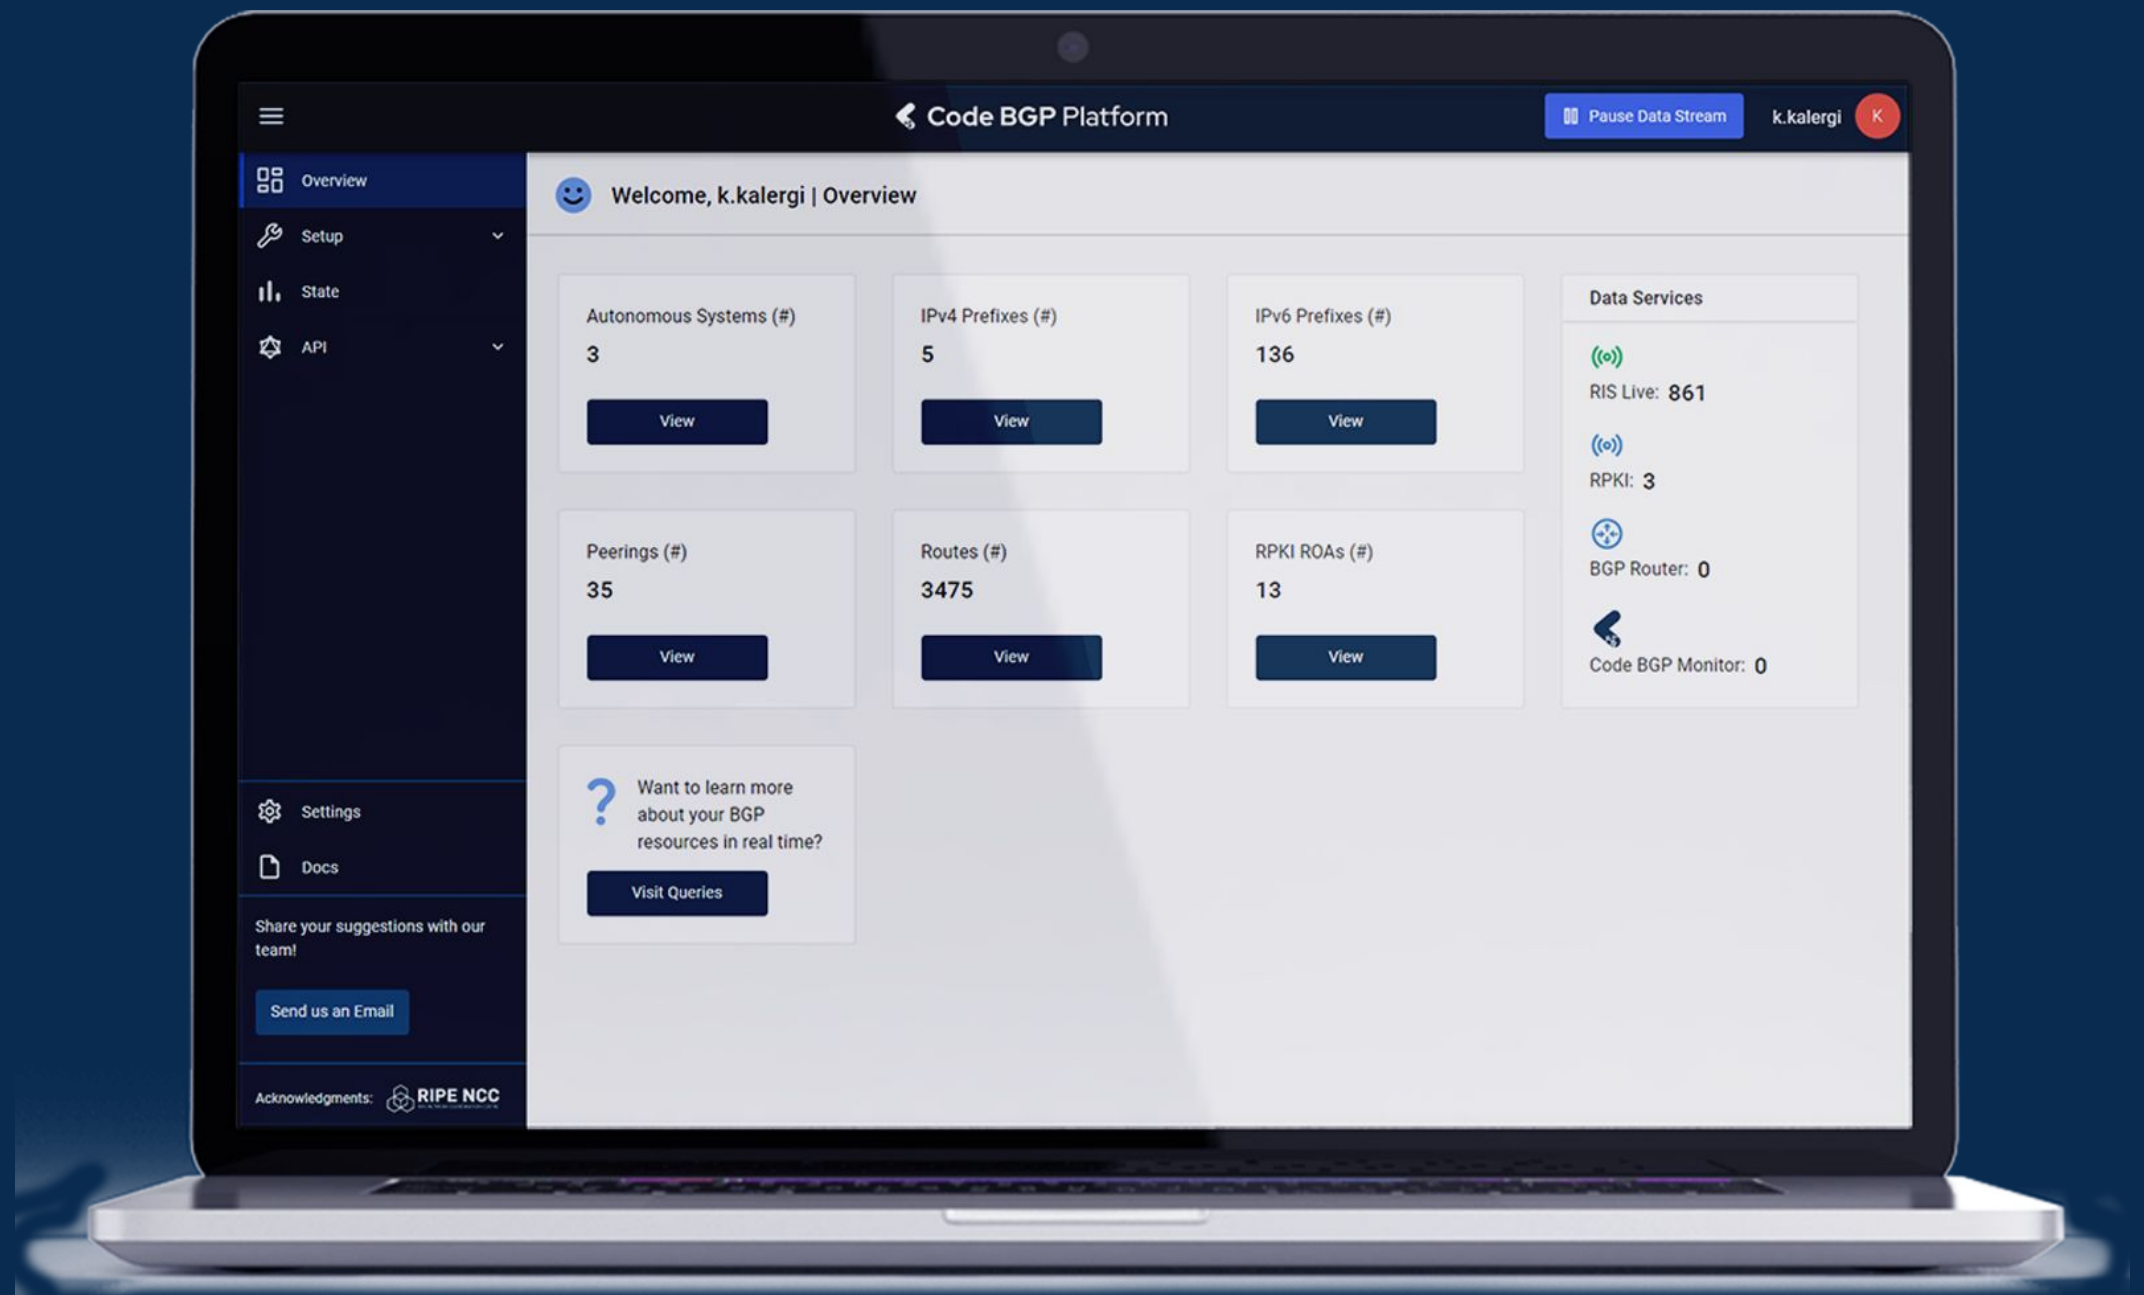

SaaS BGP stack: GoBGP
(gRPC for auto filtering)

Roadmap

1. Alerting
 - a. Metrics on BGP resources and anomaly detection
 - b. Pairwise comparisons of various data sources
 - c. BGP filtering alerts
2. Historical views + travel back in time
3. More data sources and integrations (e.g. Routeviews, IRR data, Netbox, application data)
